

Electronic Speedo Drive for Toyota T50 5 Speed Transmission

Speedo drive conversion to adapt Toyota AE101 electronic drive to AE86 mechanical drive.

The information contained in this document is intended to try to make it easier for a builder to have this adaption done by a third party.

I have tried to be as simplistic as possible so as to be enable it to be understood by builders of all mechanical/engineering levels.

I have intentionally left the photos large, to try to clarify any detail I did not explain in the text.

This modification DOES require the use of a lathe, I have tried to write it so as to allow you to go to your local machine shop, brother in law, mate or anyone with a lathe...and it will be done correctly

Much thanks to John O'Rielly (PLAGER 7) in Brisbane for passing on the information and problems he had with this modification.

Fig.1 Standard Drive Assemblies T50 left and AE101 right

Step One:- Disassembly

T50 Drive:-

Disassembly is simple, remove the “C” clip from the drive housing , just above the drive gear.
This will allow the shaft/gear assembly to be withdrawn from the housing.
Remove the “O” ring from the housing.
Wash all parts internally and externally to remove oil, grease and road grime.

Fig.2 T50 Drive Disassembled

AE101 Drive:-

Disassembly is similar to T50, remove the “C” clip from the drive housing , just above the drive gear.

This will allow the shaft/gear assembly to be withdrawn from the housing.

Remove the “O” rings from the housing.

Remove the three (3) philips head screws from the cover on the top of the drive housing.

Carefully remove cover, be aware that the small parts in side may be stuck to the cover.

Remove all internal parts, record order of assembly.

Wash housing and shaft to remove oil, grease and road grime.

Fig.3 AE101 Drive Disassembled

Step Two:- Shortening the Drive Shaft

Drive Shaft:-

The T50 drive shaft needs to be shortened to a similar length to the AE101. I reassembled the AE101 shaft and housing, and then measured from the top face of the AE101 housing down to the top of the AE101 drive shaft. (**Fig.4**) Record this reference depth, (I got 17mm) .

Fig.4 Drive Shaft Depth Std AE101 Shaft & Housing

The T50 drive shaft will need to be shortened to give the same depth as measured in **Fig.4**.

When I did mine, (and a few others), I found I needed the T50 shaft to be 68.0mm long. **Fig.5 Fig.6**

The drive shaft is hardened, so I used a belt lisher to shorten the shaft, it could as easily be done on a fine grinding wheel.

Remember slowly does it, regular checks of depth in housing and do not let the shaft get too hot during grinding/linishing, this will affect the heat treatment and consequently affect the strength of the drive dogs on the shaft end.

Carefully deburr and chamfer, end detail should be similar to original AE101.

Fig.5 T50 Shaft Before *upper* and After *lower*.

Fig.6 T50 Shaft Overall Shortened Length

Step Three:- Modify the Housings

T50 Housing:-

The modifications to the original T50 housing is really only shortening and if necessary a clean up cut of locating diameter.

The standard housing is chucked and trued up in a lathe, the threaded portion is then turned/parted off.

A 0.5mm chamfer is turned on the outer edge. **Fig.7**

If the outside diameter 22.2mm (0.875") is damaged, a light clean up cut should be taken.

Deburr the inside corner.

Fig.7 Standard T50 Housing *left* Shortened Housing *right*.

AE101 Housing:-

The modifications to the original AE101 housing is really only shortening and boring out the lower end to accept the shortened T50 housing..

The standard housing is chucked and trued up in a lathe. **Fig.8**

The extension part of the housing is turned/parted off, and the remainder is faced to clean up.

The remainder of the housing is bored out to 22.3mm (0.878), for a distance off 11.0mm deep. **Fig.9**
When boring, a thin synthetic disc will fall out with swarf (shavings), this is a slinger, and may be discarded.

Deburr the inside corners.

Fig.9 Standard AE101 *left* Modified *right*

Step Four: Assembly

This assembly process should be performed “dry” to ensure all modifications have been performed correctly.

After you are satisfied that the work has been done correctly, disassemble, and wash part in solvent, prior to final assembly.

Final Assembly:-

Apply a film of lubricant, light grease or oil will do, to the shortened T50 shaft, insert the shortened T50 shaft in to the shortened T50 housing and fit “C” clip.

Test fit the T50 housing/shaft assembly to the AE101 housing, ensure that the measurement obtained in **Fig.4** is still obtainable.

Apply a thin film of “loctite” 680, 271 or 630 to the modified T50 housing, insert the T50 housing into the modified AE101 housing until the **Fig.4** measurement is obtained.

Set aside to allow the “loctite” to cure.

When “loctite” has cured, apply a thin film of lubricant to the inside of the AE101 housing, and to all AE101 parts.

Reassemble the AE101 driven shaft, thrust disc, hex disc and “O” ring and then fit cover and 3 phillips head screws.

The only remaining job is the machining of the clearance flat on the AE101 housing. This flat is required to allow clearance to fit the retainer plate and bolt when the new modified assembly is installed in the T50 extension housing.

I held the completed assembly in the vice of my milling machine, and milled a flat as shown in **Fig.10** .

This could just as easily be done with a good sharp file.
Deburr all corners,.

Replace “O” ring in T50 part of housing.

New drive is ready to go.

Fig. 10 Milling Setup

Fig. 11 Completed Drives

Installation:-

When fitting gearbox to chassis, it may be a good idea to leave the speedo drive out, until the gearbox is all but in place. It will probably (depends upon individual chassis) be necessary to fit speedo drive before fitting and tightening rear cross member mounts to gearbox . This housing does protrude quite a bit further than the original. Please check your particular installation before commencing modifications.

Any comments, suggestions, criticism etc. please let me know
hannelleng@hotmail.com

As always, all care but no responsibility etc. etc.

Thanks Paul Hannell P3-7 Brisbane
