

Simple Chassis Mount for Sierra Type 9

Notes: On my car I gave the drivers side section of the tunnel a dog leg to allow the type 9 box to fit while still allowing some room for the driver. The tunnel shown on the sketch is based on a standard chassis and may need changes to suit.

Don't scale off the drawing it is just a rough sketch to show the idea, on my car the tail end of the gearbox fell in line with member B2.

Escort, Cortina/Capri and old MK2 2000e gearboxes have mounts in different positions from the Type 9.

The design involves bolting through a 25x25 rhs --- use tubular spacers on the inside of tube to prevent it being crushed and use large washer.
